

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Benzyticillin (Group 1)	Pencillins β-lactams Group 1 = long acting parenteral Group 2 = oral absorption Group 3 = anti-Staphylococcal Group 4 = extended spectrum Group 5 = anti-pseudomonal Group 6 = β-lactamase resistant	<ul style="list-style-type: none"> • Destruction of antibiotic by β-lactamases • Failure to penetrate outer cell wall of most Gram-negative bacteria • Efflux across outer membrane of Gram-negative bacteria • Low-affinity binding of antibiotic to PBPs 	Meningitis: Grp A, Grp B, NM Endocarditis: Streptococcal + Enterococcal Neuro syphilis	<ul style="list-style-type: none"> • Allergic reactions- skin rashes, serum sickness, delayed hypersensitivity <10% exposed • Anaphylaxis (0.004-0.4%) • GI – diarrhoea, enterocolitis • Haematological – haemolytic anaemia, neutropenia, thrombocytopenia • Elevated transaminases (fluclo), electrolyte abnormalities • Renal – intestinal nephritis. Haemorrhagic cystitis. • CNS – encephalopathy/ seizures in renal failure or prolonged high dosing 	IV		Concentration dependent bactericidal activity Get persistent survivors, phenomenon known as tolerance Inhibit cell wall synthesis by binding to PBPs and inhibiting transpeptidation of peptidoglycan Synergy with aminoglycosides in order to improve speed of bactericidal effect	
Penicillin V (Group 2)			Oral					
Methicillin (Group 3)								
Flucloxacillin (Group 3)								
Amoxicillin (Group 4)			Use in combination with aminoglycoside for R Gram-ve					
Ampicillin (Group 4)								
Ticarcillin (Group 5)								
Piperacillin (Group 5)								
Timocillin (Group 6)								

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action	
Cefradine (1 st gen)	Cephalosporins β-lactams 1 st gen = primarily against Gram-pos 2 nd gen = enhanced Gram-neg variable Gram-pos Cephamicin grp = better against anaerobes 3 rd gen = Gram-neg improved 4 th gen = includes Pseudomonas cover	<ul style="list-style-type: none"> • Destruction of antibiotic by β-lactamases • Failure to penetrate outer cell wall of most Gram-negative bacteria • Efflux across outer membrane of Gram-negative bacteria • Low-affinity binding of antibiotic to PBPs • SHV • TEM • AmpC 	UTI Strep and Staph skin and soft tissue infections	<ul style="list-style-type: none"> • Hypersensitivity – rash, urticaria, serum sickness • Anaphylaxis (0.01) • GI – diarrhoea, nausea and vomiting, transient hepatitis, biliary sludging (ceftriaxone) • Haematological – eosinophilia, haemolytic anaemia, neutropenia, thrombocytopenia, clotting abnormalities, platelet dysfunction • False laboratory tests – Coombs' test, serum creatinine, glycosuria • Renal – intestinal nephritis. • CNS – seizures • Drug fever • Disulfiram-like reaction • Phlebitis 	Oral (PO) IV IM		Concentration dependent bactericidal activity		
Cefalaxin (1 st gen)			2 nd & 3 rd gen are inactivated by β-lactamases. Never use to treat: Enterobacter spp. Serratia spp. <i>Citrobacter freundii</i> , Acinetobacter spp, Proteus vulgaris, Providencia spp. <i>Morganella morganii</i> (ESCAPPM)		Oral (PO) IV IM				Get persistent survivors, phenomenon known as tolerance
Cefuroxime (2 nd gen)			2 ^{ng} gen – CAP, early Lymes, otitis media		Oral (PO) IV IM				Inhibit cell wall synthesis by binding to PBPs and inhibiting transpeptidation of peptidoglycan
Cefoxitin (2 nd gen) Cephamicin grp			Cephamicins-Intra-abdominal Pelvic, gynae, soft tissue		Oral (PO) IV IM				Synergy with aminoglycosides in order to improve speed of bactericidal effect
Cefotaxime (3 rd gen)			3 rd gen – pen R pneumococci, URTI, LRTI, meningitis, Lyme disease, typhoid, severe Shigella, OPAT for endocarditis & osteomyelitis		Oral (PO) IV IM				
Ceftriaxone (3 rd gen)			3 rd gen = Gram-neg improved		Oral (PO) IV IM				Post antibiotic effect against Gram-positives
Ceftazidime (3 rd gen)			4 th gen = includes Pseudomonas cover		Oral (PO) IV IM				
Cefixime (3 rd gen)					Oral (PO) IV IM				
Cefpodoxime (3 rd gen)					Oral (PO) IV IM				
Cefepime					Parenteral				

(4 th gen)			infections			
Cefpirome (4 th gen)					Parenteral	

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Co-amoxiclav	β -lactamase inhibitors β -lactams Inhibit β -lactamases due to SHV and TEM	<ul style="list-style-type: none"> Destruction of antibiotic by β-lactamases Failure to penetrate outer cell wall of most Gram-negative bacteria Efflux across outer membrane of Gram-negative bacteria Low-affinity binding of antibiotic to PBPs 	Otitis media Sinusitis Soft tissue Pneumonia Bite infections Diabetic foot ulcers	Similar to ampicillin	Oral IV		Concentration dependent bactericidal activity Get persistent survivors, phenomenon known as tolerance Inhibit cell wall synthesis by binding to PBPs and inhibiting transpeptidation of peptidoglycan Synergy with aminoglycosides in order to improve speed of bactericidal effect	
Ticarcillin-clavulanate			Use for Pseudomonas and Proteus spp. Pneumonia, intra-abdominal infection, gynae infections skin/soft tissue osteomyelitis	Cholestatic jaundice + other β -lactam side effects	IV only			
Ampicillin-sulbactam			Available in the USA Skin/soft tissue Intra-abdominal Gynae infections <i>Acinetobacter baumannii</i> carbapenem resistant	Similar to ampicillin	IV only			
Piperacillin-tazobactam			Pneumonia (especially <i>Pseudomonas aeruginosa</i>) Skin/soft tissue Intra-abdominal UTI Polymicrobial Bacteraemia	Similar to piperacillin	IV only			

			Febrile neutropenia (combined with an amino-glycoside)				
--	--	--	--	--	--	--	--

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Imipenem	Carbapenems β -lactams Derived from <i>Streptomyces cattleya</i> Used for severe infections: Bacteraemia Intra- abdominal infections Obstetric infections Gynae infections	4 mechanisms: <ul style="list-style-type: none"> • Production of low-affinity PBP target • Reduced membrane permeability due to absence of OprD in Gram-neg • Efflux in Gram-negatives • Carbapenemase enzymes <ul style="list-style-type: none"> ○ Class A (functional grp 2f) SME, IMI, NMC, KPC, GES ○ Class B (functional grp 3): IMP, VIM, GIM, SVM ○ Class D (functional grp 2d): OXA 	Slightly more active than others against Gram-pos Serious infections: Polymicrobial Febrile neutropenia Nosocomial infection DON'T USE FOR MENINGITIS! Most appropriate for ESCAPPM pathogens Enterobacter spp. Serratia spp. <i>Citrobacter freundii</i> Acinetobacter <i>Proteus vulgaris</i> Providentia spp. <i>Morganella morganii</i>	<ul style="list-style-type: none"> • Causes seizures so DON'T USE in meningitis cases • Require dose modification in renal failure • Need to co-administer with cilastatin a DHP-1 inhibitor as it's a substrate for renal dehydropeptidase-1 (DHP-1) • Nausea if infused too quickly 	IV		High affinity to most high molecular weight PBPs of Gram-positive and Gram-negative bacteria Traverse Gram-negative outer membrane proteins through different outer membrane proteins than cephalosporins and penicillins – OprD rather than OmpC and OmpF, especially Imipenem	
Meropenem	Complicated UTI Soft tissue and bone infections	○ Class B (functional grp 3): IMP, VIM, GIM, SVM ○ Class D (functional grp 2d): OXA	Slightly more active against Gram-neg than Imi Most active against <i>Pseudomonas aeruginosa</i> Bacterial meningitis Most appropriate for ESCAPPM pathogens Serious infections: Polymicrobial	<ul style="list-style-type: none"> • Require dose modification in renal failure • All carbapenems can cause rash, urticarial, cross-reactivity with penicillin, immediate hypersensitivity 	IV			

			Febrile neutropenia Nosocomial infection					
Ertapenem			Slightly more active against Gram-neg than Imi Poor activity against <i>Pseudomonas aeruginosa</i> and <i>Acinetobacter</i> spp.	Require dose modification in renal failure	Once daily dosing so good for OPAT IV			
Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Aztreonam	Monobactam β -lactams Produced by <i>Chromobacterium violaceum</i>	Susceptible to AmpC but not most other β -lactamases	Only some Gram-negatives Enterobacteriaceae, Neisseria, Haemophilus, Never use as monotherapy UTI Pneumonia Septicaemia Skin/soft tissue Intra-abdominal Gynae Wounds Burns	<ul style="list-style-type: none"> Allergic reactions- skin rashes, serum sickness, GI – diarrhoea, enterocolitis Haematological – haemolytic anaemia, neutropenia, thrombocytopenia Electrolyte abnormalities Renal – intestinal nephritis. Haemorrhagic cystitis 	IV IM		Passes through outer membrane protein and binds to PBP3 of Gram-negative bacteria	
Bactitracin			Used to identify Group A Streptococci as they are Bacitracin resistant		Topical only as it is toxic due to similar reactions in eukaryotic cells		Binds to isoprenylphosphate and prevents dephosphorylation of the lipid carrier that transports cell wall building blocks across the membrane – means	

							native compound cannot regenerate
Fosfomycin			UTI Broad spectrum against Gram-negative bacilli				Inhibits pyruvyl transferase and therefore the formation of N-acetylglucosamine from N-acetylmuramic acid.
Cycloserine			2 nd line-regimen for drug resistant tuberculosis				Structural analogue of D-alanine, acts on alanine racemase and synthetase to inhibit the sunthesis of terminal D-alanyl-D-alanine. = prevents the formation of the pentapeptide chain of muramic acid
Isoniazid			1 st line treatment for TB				Interfere with mycolic acid synthesis in mycobacterial cell walls
Ethambutol			1 st line treatment for TB				Interfere with mycolic acid synthesis in mycobacterial cell walls

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Vancomycin	Glycopeptides Vancomycin	Intrinsic vanc R in : <i>Leuconooc</i> , <i>Pediococcus</i> ,	Broad Gram-positive activity	Dose reduction in renal impairment – must monitor	Usually given by IV but can be given orally,		Inhibit cell synthesis by binding D-alanyl-D-alanine tail of	

	<p>from <i>Nocardia orientalis</i></p> <p>Teicoplanin from <i>Actinoplanes teichomyceticus</i> – not available in USA</p>	<p><i>Lactobacillus</i>, <i>Erysipelothric rhusiopathiae</i></p> <p>Intrinsic Teic R in <i>S. haemolyticus</i></p> <p>Enterococci: 6 types of glycopeptide R:</p> <ul style="list-style-type: none"> ○ VanA – <i>Staph aureus</i>, <i>E. faecium</i>, <i>E. faecalis</i> ○ VanB – <i>E. faecium</i>, <i>E. faecalis</i> ○ VanC – intrinsic in <i>E.gallinarum</i>, <i>E. asselflavius</i>, acquired in <i>E. flavescens</i> ○ VanD – <i>E. faecium</i> ○ VanE – <i>E. faecalis</i> ○ VanG – <i>E. faecalis</i> <p>Named based on lipase genes = result in the formation of a peptidoglycan precursor with decreased affinity</p>	<p>Used for: Severe MRSA infections Meningitis due to pen R Strep pneumoniae Orally for <i>C. difficile</i> assoc. diarrhoea Febrile neutropenia CAPD peritonitis Endophthalmitis CSF shunt infections (intrathecal) CVL infections</p> <p>Poor CSF penetration in the absence of inflammation</p>	<p>trough levels after the 3rd dose, should be 10 – 15mg/l</p> <p>If trough level too high reduce dose rather than altering dosing frequency (as kill is time dependent)</p> <p>Ototoxicity – rare if no renal toxicity</p> <p>Nephrotoxicity – often associated with concomitant aminoglycoside usage</p> <p>Red-man syndrome associated with rapid infusion</p> <p>Neutropenia, thrombocytopenia, rashes, drug fever</p>	<p>intraperitoneally intrathecally, Intraocularly</p>		<p>muramylpentapeptide Complex cannot be processed by the enzyme glycosyltransferase. Inhibits the inc of the murein monomers (N-acetylmuramic acid & N-acetylglucosamine) into peptidoglycan chain</p>
Teicoplanin				<p>Dose reduction in renal impairment</p> <p>Don't need to monitor for</p>	<p>Usually given by IV but can be given intramuscularly, or</p>		

		for glycopeptides Vancomycin tolerance has been reported in <i>Strep pneumoniae</i>		kidney function but monitoring sometimes done in severe infections to monitor therapeutic levels Neutropenia, thrombocytopenia, rashes, drug fever	intraperitoneally Long half-life so can daily dose Better bone penetration than vancomycin

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Nalidixic acid	Quinolones	<ul style="list-style-type: none"> mainly due to 	UTIs	<ul style="list-style-type: none"> Dose 	Oral	Reduced	Prevent bacterial	

(Group 1) Ciprofloxacin (Group 2)	Group 1 – active against Enterobacteriaceae Group 2 – active against Enterobacteriaceae, Pseudomonas spp. & some GPC Group 3 – not available in UK active against GPC Group 4 – enhanced activity against GPC & anaerobes	spontaneous chromosomal mutation <ul style="list-style-type: none"> alter the target enzymes – stepwise inc. resistance by sequential mutations of <i>gyrA/gyrB</i> and <i>parC/parE</i> alter cell membrane permeability – due to mutations that reduce porin channel entry or inc. efflux – In <i>P. aeruginosa</i> due to over expression of MexAB-OprM efflux pump <ul style="list-style-type: none"> MexA – membrane fusion protein MexB – inner membrane efflux pumps OprM – outer membrane protein Plasmid-mediated resistance encoded by the <i>qnr</i> gene on <i>K. pneumoniae</i>, <i>E. coli</i> etc 	<ul style="list-style-type: none"> UTIs, prostatitis, gonorrhoea, pseudomonal infections in CF patients, anthrax, prophylaxis in <i>N. meningitidis</i> Give high dose Cipro where penetration sub-optimal VAP, septic arthritis, CF, osteomyelitis, meningitis, intra-ocular infections + serious Pseudomonal infections 	adjustments need to be made on renal function <ul style="list-style-type: none"> GI side effects CNS – headache, dizziness, insomnia May induce seizures so MUST NOT be used in epileptics Not used in young children or adults with a history of tendon disorders (Beagles) Moxi – leucopenia, eosinophilia hepatitis Allergic reactions – rash etc 	Oral IV Oral IV Oral Oral	bioavailability by co-administration of antacids	nucleic acid synthesis by inhibiting DNA gyrase & topoisomerase IV DNA gyrase consists of α & β subunits which are encoded for by <i>gyrA</i> & <i>gyrB</i> Quinolones inhibit DNA supercoiling mainly through action on the α -subunit of DNA gyrase. Topoisomerase IV consists of 2 units encoded fro by <i>parC</i> and <i>parE</i> genes. Topoisomerase is involved in DNA relaxation and chromosomal segregation. DNA gyrase = main target in Gram-ves Topoisomerase = main target in Gram-pos =bactericidal
Levofloxacin (Group 2)			Sinusitis, COPD exacerbation, CAP, UTI, Chronis prostatitis, skin & soft tissue, M. tb		Oral IV		
Norfloxacin (Group 2)			UTI Chronic prostatitis		Oral		
Ofloxacin (Group 2)			UTIs, chronic prostatitis, LRTI, skin & soft tissue, gonorrhoea, genital chlamydia, non-gonococcal urethritis, pelvic inflammatory disease				
Moxifloxacin (Group 4)			COPD exacerbations, CAP (2 nd line) M. tb		Oral		

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Metronidazole	Nitroimidazoles	<ul style="list-style-type: none"> Rare and a combination of mechanisms is required – both chromosomal & plasmid mediated Bacteroides spp. have transferable genes <i>nimA</i> & <i>nimD</i> <i>H. pylori</i> resistance associated with mutational inactivation of <i>rdxA</i>, <i>frxA</i>, <i>fdxB</i> Resistance in <i>T. vaginalis</i> & <i>Giardia</i> is probably multifactorial with reduced activation of metronidazole and/or reduced transcription of the ferredoxin gene 	<ul style="list-style-type: none"> Parasitic infections Anaerobic infections <i>C. difficile</i> enterocolitis <i>H. pylori</i> eradication therapy Small bowel overgrowth Pouchitis Infected leg ulcers Pressure sores Pelvic inflammatory disease Surgical prophylaxis Acute ulcerative gingivitis 	<ul style="list-style-type: none"> Abnormal metallic taste GI Peripheral neuropathy with prolonged treatment Disulfiram-like reaction with alcohol CNS symptoms Mucocutaneous candidiasis Transient darkened urine 	<ul style="list-style-type: none"> Oral IV Per vagina Per rectum Topical 	<p>BEWARE of using if patient is on:</p> <p>Co-amoxiclav Imipenem Meropenem Clindamycin Piperacillin-tazobactam</p> <p>As these drugs already have anaerobic cover</p>	<p>Pro-drug that needs to be activated. Has a low molecular weight and enters the organism by passive diffusion.</p> <p>Activated by reduction in its nitro group by a nitroreductase results in formation of metronidazole radicals.</p> <p>Leads to highly reactive compounds that interact with nucleic acids & proteins leading to cell death = bactericidal</p>	

Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Nitrofurantoin	Nitrofurans	<p>Most ESCAPPM pathogens are resistant + pseudomonas</p> <p>In <i>E. coli</i> resistance is chromosomal or plasmid mediated and assoc. with inhibition of nitrofurantoin reductase action</p>	<p>Acute non-complicated cystitis (NOT pyelonephritis) – 3 days</p> <p>Recurrent UTIs – 7 days</p> <p>Prophylaxis of recurrent UTIs</p>	<p>Dose modification required in renal patients</p> <p>GI – nausea & vomiting</p> <p>Pulmonary – acute hypersensitivity (fever, cough, dyspnoea, pulmonary infiltrates, myalgia, eosinophilia)</p> <p>Chronic (pulmonary fibrosis, bronchiolitis obliterans organizing pneumonia)</p>	Oral enhanced by food			<p>Mechanism poorly understood</p> <p>Like Metronidazole required enzymatic reductions within the bacterial cell</p> <p>Appear to damage bacterial DNA like the quinolones and inhibit DNA repair</p> <p>Bactericidal against urinary pathogens</p>
Rifampicin	Rifamycins Semi-synthetic derivatives of rifamycin B, naturally isolated from <i>Streptomyces mediterranei</i> , converted rifamycin B into rifamycin S which is more active	<ul style="list-style-type: none"> • Rapid emergence of resistance due to mutation in <i>rpoB</i> gene (encodes a β-subunit of DNA-dependent polymerase) • Use in combination with unrelated antibiotics to suppress emergence of resistance • Rifabutin 	<ul style="list-style-type: none"> • TB • Leprosy • Serious or device related Staphylococcal infection • Pneumococcal • Legionella • Elimination of nasal carriage – <i>N. meningitidis</i> & <i>H. influenzae</i> 	<p>Orange fluids</p> <p>Skin rashes</p> <p>STOP DRUG if thrombo-Cytopaenia</p> <p>‘Rifampicin Flu’ – in intermittent therapy</p>		<ul style="list-style-type: none"> • All stimulate hepatic metabolism by CYP450 enzyme system • Rifabutin interacts with Clarithromycin and ritonavir • Rifampicin enhances own activity & that of other drugs: <ul style="list-style-type: none"> ○ Warfarin ○ Corticosteroids ○ Protease inhibitors ○ Oral contraceptives 	<p>A number of shared features:</p> <ul style="list-style-type: none"> • Inhibit bacterial DNA-dependent RNA polymerase • Bactericidal 	
Rifabutin	(also Rifapentine,		<ul style="list-style-type: none"> • Atypical mycobacteria • Treatment of <i>M. tb</i> 	<p>Skin rashes</p> <p>GI upset</p> <p>Hepatitis</p>	Oral			

	Rifamide, Rifamycin SV, Rifaximin – not available UK)	resistance less than Rifampicin	in those who can't have Rifampicin <ul style="list-style-type: none"> MAC prophylaxis in AIDS patients 	Neutropenia Uveitis Arthralgia – with high doses				
Antimicrobial	Class	Resistance	Use	Side Effects	Delivery	Interactions	Synergy	Action
Polymixin B	Polymixins		Severe infections due to MDR Gram-ve organisms	Dose related nephrotoxicity	Topical IV IM			Cyclic cationic polypeptide detergents = penetrate cell membranes & interact with phospholipids to disrupt membranes = rapidly bactericidal
Polymixin E/Colistin			SDD Aerosolized for CF patients IV for severe MDR Gram-ve i.e. VAP	Dose related neurotoxicity: Paraesthesia Peripheral neuropathy Neuromuscular blockade	Colistin sulfate = topical nebulized Colistimethate = IV IM			
Fusidic acid	Fusidane Derived from <i>Fusidium coccineum</i>	<ul style="list-style-type: none"> Chromosomal mutations in the <i>fusA</i> gene which encodes for the elongation factor Plasmid mediated mutations result in reduced permeability to the drug Use fusidic acid combined with another agent 	Staphylococcal infections: <ul style="list-style-type: none"> Skin & soft tissue Bacteraemia Septic arthritis Osteomyelitis LRTI in CF Erythrasma due to <i>Corynebacterium minutissimum</i> Lepromatous leprosy	Nausea Vomiting Reversible jaundice IV form assoc. with thrombophlebitis & jaundice Ophthalmic preparations may itch/sting Drug induced, immune mediated thrombocytopenia	Oral Topical IV	Metabolized by CYP	Bacteriostatic Inhibits protein synthesis by blocking elongation factor G	
Mupirocin	Pseudomonal acid produced by <i>Pseudomonas fluorescens</i>	<ul style="list-style-type: none"> Low level resistance is due to spontaneous mutation resulting in altered access to binding sites in isoleucyl tRNA synthetase 	<ul style="list-style-type: none"> Prolonged use of >7 days discouraged Skin infections i.e. impetigo, folliculitis Nasal 	Local reactions such as pruritis, burning sensation, rash, urticarial = particularly on broken skin	Topically as a cream = bactroban or nasal ointment Bactroban nasal		Bacteriostatic Inhibits bacterial RNA & protein synthesis by binding to bacterial isoleucyl tRNA synthetase = prevents	

		<ul style="list-style-type: none"> High level resistance is via transferable plasmids by the <i>mupA</i> gene which codes for a modified enzyme 	<ul style="list-style-type: none"> decolonisation of SA or MRSA Used for secondarily infected eczema, burns, ulcers 				incorporation of isoleucine into protein chains in the bacterial cell wall
